

Overseeding Your Lawn

Grow Great Grass

You want that great lawn that makes heads turn? We got you. Ask any of our employees on the best products for lawn care, or for questions.

1. Mow your lawn to approximately 1 ½ inches.
2. Prepare your lawn with either a leaf rake or special dethatching rake. These tools remove old thatch & potential weeds.
3. If you need to bring up your pH, apply your pelletized calcium lime (**Espoma Lightning Lime**) using the spreader for best coverage. Another great product for treating your soil is **Jonathan Green Mag-I-Cal**.
4. Apply your lawn fertilizer (**Espoma Organic Lawn Fertilizer, Milorganite, or Jonathan Green Winter Survival Fall Food**).
5. Apply your grass seed (**Jonathan Green Ultra, Shady Nook, or Sun & Shade**).
6. Cover with no more than ¼ inch compost manure.
7. Water after applying your seed. Water lightly for 20 minutes every morning and evening. In order for germination, the seed must be kept moist.
8. Once your seed has germinated, only water in the morning for 20 minutes until it's well established.

*Do not mow your grass until it has reached 3 to 4 inches. Continue to deeply water your lawn once a week.
